Regional Informational Report¹ No. 3A00-09

January 2000

¹The Regional Information Report Series was established in 1987 to provide an information access system for all unpublished divisional reports. These reports frequently serve diverse ad hoc informational purposes or archive basic uninterpreted data. To accommodate timely reporting of recently collected information, reports in this series undergo only limited internal review and may contain preliminary data; this information may be subsequently finalized and published in the formal literature. Consequently, these reports should not be cited without prior approval of the author or the Commercial Fisheries Division.

OFFICE OF EQUAL OPPORTUNITY (OEO) STATEMENT

The Alaska Department of Fish and Game conducts all programs and activities free from discrimination on the basis of sex, color, race, religion, national origin, age, marital status, pregnancy, parenthood or disability. For information on alternative formats available for this and other department publications, please contact the department ADA Coordinator at (voice) 907-465-4120, (TDD) 1-800-478-3648, or (fax) 907-586-6596. Any person who believes s/he has been discriminated against should write to: ADF&G, P.O. Box 25526, Juneau, AK 99802-5526; or O.E.O., U.S. Department of Interior, Washington, DC 20240.

INTRODUCTION

The Niukluk River is a tributary of the Fish River, which empties into Golovin Bay on the north coast of Norton Sound. The Niukluk River enters the Fish River approximately ten miles above the village of White Mountain (Figure 1). The village of Council is located on the Niukluk River approximately twelve miles from its confluence with the Fish River. There is road access to the Niukluk River at the village of Council. Subsistence and sport fisheries occur on the Niukluk River.

The counting tower has successfully operated since 1995 (Rob 1995, 1997, 1998 and 1999). A counting tower on the Niukluk River was operated for approximately three weeks in 1979 (Schaefer, 1979). The project is operated to obtain more timely and accurate escapement information required for the active management of salmon stocks throughout the season and as a means to calibrate the accuracy of aerial surveys on the other components of the Fish River system.

OBJECTIVES

1. Obtain daily and seasonal estimates of the timing and magnitude of the salmon and Dolly Varden escapement, by species, to the Niukluk River.
2. Collect and analyze age, sex and length information from beach seine sampled chum and coho salmon.

METHODS

The Niukluk River tower camp is located approximately 2 miles upstream from the confluence of the Fish and Niukluk Rivers (Figure 1). The tower camp is just upstream of Tom Gray's camp, which is locally known as Mosquito Bar. A letter of understanding from the Council Native Corporation authorizes the tower and weir operation. Permits for the weir were issued by the Alaska Department of Fish & Game (ADF&G), Habitat Division and the Alaska Department of Natural Resources, Division of Land. The camp and tower site is leased for five years on an annual renewal basis from Tom Gray.

Crewmembers began working in Nome on 1 July, 1999. The first two days were spent inventorying and purchasing equipment and supplies. The equipment and supplies were trucked to Council, with the assistance of additional ADF&G personnel from Nome. The boats were prepared for use and loaded up. Two trips were needed to ferry all of the supplies and equipment to the tower site. The site was inventoried and the camp was set up.

For 1999, the tower, flash panel and partial weir were installed directly in front of the sleeping tent, the same location as in 1996. The counting tower, partial weir and flash

panel were installed using the same methods as reported in detail in the 1995 project report (Rob, 1995). The partial weir installation proceeded smoothly and rapidly because three additional crewmembers from Nome provided assistance.

A 120 volt lighting system was installed on the tower to illuminate the flash panel during dark periods. These lights were powered by a portable generator. Beginning in early August the lights operated continuously from dusk to dawn.

The ADF&G, Commercial Fisheries Division (CFD) provided operational funding for the Niukluk River counting tower for the period beginning 4 July and ending 8 September. In previous years ADF&G, Sport Fish Division provided funding for the month from 16 August through 15 September. Counting began at 0000 hours on 4 July. The crew counted 18 half-hour counts in three six hour shifts each day except Tuesdays and Wednesdays. The first shift ran from 0000 hours to 0530 hours, the second ran from 1200 hours to 1730 hours and the third shift ran from 1800 hours to 2330 hours. On Tuesdays the half-hour counts ran for 24 hours in three eight hour shifts. Wednesdays were the day off. To reduce the risk of missing the peak hours of the coho salmon escapement, the ADF&G, Sport Fish Division requested that the schedule be modified during the first two weeks of August to count from 0000 through 0500 hours on the day off.

The counts for each half hour shift were doubled to produce the reported hourly counts for each species. Each day the reported hourly counts were added to produce a daily subtotal. Every day, the daily and cumulative subtotals for each species were relayed to the Nome office by radio.

The expanded counts for this report were calculated using the following methods. The 18 hour counts for Wednesdays (the day off) were estimated by adding the counts of each hour of the day before (Tuesdays) to the counts of each hour of the day following (Thursdays) and dividing the result by two, giving expanded hourly counts for 18 hours of the day off. Escapement during the 6 hours not normally counted was estimated using data observed during the 24 hour count days. For each 24 hour count day, the ratio of the count from 0600 hours to 1200 hours to the count during the normal 18 hour counting period was computed. The 18 hour count for the three days before and after each 24 hour count day was multiplied by the ratio to estimate escapement during the 6 hours not normally counted. This 6 hour estimate was added to the 18 hour count for each day. This was done for all species counted.

The expanded counts for the hours missed, during the days off or while the crew was beach seining, were estimated as follows. For a day the normal 18 hour count was missed, the count for each missing hour was calculated by adding the count of the hour of the day before the missed period to the counts of the hour of the day following the missed period and dividing the result by two (Rob 1999).

On most Wednesdays the crew went to White Mountain to pick up groceries, supplies and mail that were sent from Nome via air. Groceries, supplies and mail were also periodically brought to Council by Nome staff.

Beginning 19 July, the crew began beach seining and sampling chum salmon for age, length and sex data. If 40 or less chum salmon were available, then all were sampled. If more than 40 chum salmon were available, then 40 were sampled. Coho salmon were not sampled this year because the large numbers of pink salmon made any beach seining difficult during July and early August and high water ended the counting season early this year.

RESULTS

Table 1 shows the expanded daily and cumulative totals for each species.

The reported total hourly counts were: 21,714 chum salmon, 11,970 pink salmon, 38 king salmon, 3,106 coho salmon, and 1,860 Dolly Varden (Tables 7-11). The expanded counts were: 35,240 chum salmon, 20,355 pink salmon, 40 king salmon, 4,260 coho salmon, and 3,170 Dolly Varden (Tables 2-6). Figure 2 shows a graph of the daily cumulative expanded passage of all salmonid species counted, except pink salmon. Figures 3-12 show graphs of the expanded daily totals and the cumulative daily totals for each species.

Chum salmon and Dolly Varden, were observed on 4 July, the first day of counting. King salmon were first observed on 11 July and coho salmon were first observed on 28 July (Table 1). The daily peak count of 2,197 chum salmon occurred on 18 July, the daily peak count of 1,218 pink salmon occurred on 4 August, the daily peak count of 10 king salmon occurred on 12 July, the daily peak count of 425 coho salmon occurred on 2 September, the daily peak count of 229 Dolly Varden occurred on 26 August (Table 1).

Most chum salmon returned during the first three weeks of counting when 89% passed the tower (Table 1 and Figures 3 and 4). Most pink salmon returned during the first three weeks of counting when 73% passed the tower (Table 1 and Figures 5 and 6). All king salmon returned during the first four weeks of counting (Table 1 and Figures 7 and 8). Most coho salmon returned during the last four weeks of counting when 81% passed the tower (Table 1 and Figures 9 and 10). Dolly Varden returned in pulses with peaks on 11 July and on 22 and 26 August (Table 1 and Figures 11 and 12).

All species counted exhibited a diurnal pattern of migration past the counting tower. The greatest hourly chum salmon migration occurred during the hour from 2100 to 2200 hours, when 10.9% passed the tower. During the eleven hour period from 1500 through 0200 hours, 73.0% of the chum salmon passed the tower (Table 2 and Figure 13). The greatest hourly pink salmon migration occurred during the hour from 1800 to 1900 hours and during the hour from 2200 to 2300 hours, when 8.2% passed the tower. During the ten hour period from 1600 through 0200 hours, 60% of the pink salmon passed the tower

(Table 3 and Figure 14). The greatest hourly king salmon migration occurred during the hour from 0100 to 2000, when 25% passed the tower. During the six hour period from 1900 through 0100 hours 92.5% of the king salmon passed the tower. There was a net downstream migration of king salmon during the hours from 0300 through 1500 hours (Table 4 and Figure 15). The greatest hourly coho salmon migration occurred during the hour from 0000 through 0100 hours, when 13.4% passed the tower. During the three hour period from 2300 through 0200 hours 31.1% of the coho salmon passed the tower. During the seven hour period from 2100 through 0400 hours, 47.3% of the coho salmon passed the tower (Table 5 and Figure 16). The greatest hourly Dolly Varden migration occurred during the hour from 2200 to 2300, when 10.1% passed the tower. During the eight hour period from 2200 through 0600 hours, 48% of the Dolly Varden passed the tower (Table 6 and Figure 17).

An aerial survey of the entire Niukluk River counted 640 chum salmon on 24 August, 1999. The total season expanded tower count of chum salmon was 35,240. The aerial survey counted 1.5% of the total season expanded tower count of chum salmon. The aerial survey counted 540 chum salmon above the counting tower on 24 August, when the cumulative tower count of chum salmon was 35,124. The aerial survey counted 1.5% of the cumulative tower count on 24 August (Table 1). The aerial survey was conducted too late to get a good estimate of chum escapement.

An aerial survey of the entire Niukluk River counted no pink salmon on 24 August, 1999. The total season expanded tower count of pink salmon was 20,355. The aerial survey counted 0% of the total season expanded tower count of pink salmon. The aerial survey was conducted to late in the season too get a good count on pink salmon above the counting tower (Table 1).

Readable scales were collected from a total of 350 chum salmon. Beach seine samples were collected from 19 July through 29 August. The age composition of the beach seine sample was 1.1% age-0.2, 67.4% age-0.3, and 31.4% age-0.4. Male chum salmon were 47.4% and female chum salmon were 52.6% of the sample. For all age-sex categories younger fish were smaller and males were larger than females (Tables 12).

Climatological and stream observations are shown in Table 13.

DISCUSSION

A counting tower project was operated on the Niukluk River in 1979. That project collected incomplete data from 9 July to 27 July (Schaefer, 1979).

The Niukluk River counting tower project was operated as a cooperative project between ADF&G and the Kawerak Corporation in 1994. Rains throughout the summer kept water levels high and an early August flood washed out the partial weir so that no useable data was collected. However, much was accomplished in 1994, the camp infrastructure of tent

platforms was built and an appreciation of the difficulties associated with operating on the Niukluk River was gained (Charles Lean, ADF&G, CF Division, personal communication). In 1995 the Niukluk River counting tower operated successfully for the first time. Steadily decreasing water levels for most of the season and improved partial weir equipment were the primary reasons for this success (Rob, 1996). In 1996 the counting tower was operated successfully again, except for the period from 25 July through 3 August when the partial weir was washed out (Rob 1997). In 1997 the counting tower was operated successfully again, except for the five day period from 30 August through 4 September when high water prevented counting(Rob 1998). In 1998, counting began at 0000 hours on 4 July. The estimated passage of 883 chum, 931 pink salmon, 42 king salmon and 74 Dolly Varden by midnight on 4 July indicates that passage began several days earlier (Rob 1999).

In 1999, counting began at 0000 hours on 4 July. The estimated passage of 4 chum salmon and 55 Dolly Varden by midnight on 4 July indicates that passage began several days earlier (Tables 2-4 and 6). Coho salmon passage began well after the tower began operating (Table 5).

The run-timing of chum salmon in 1999 was later than the 1995-1998 average run-timing. The magnitude of the escapement was about 42% of the 1995-1998 average escapement (Figures 18 and 23). The run-timing of the odd year pink salmon escapement in 1999 was about ten days later than the odd year average escapement and the magnitude of the 1999 escapement was about 16% greater than the odd year escapement average (Figures 19 and 24). The run-timing of the king salmon escapement in 1999 was much later than 1995-1998 average run-timing. The king salmon escapement in 1999 was the lowest since the project began in 1995(Figures 20 and 25). The run-timing of the coho salmon escapement in 1999 was approximately eight days later than the 1995-1998 average. The magnitude of the 1999 coho salmon escapement was similar to the 1995 and 1997 levels (Figures 21 and 26). The run-timing of the 1999 Dolly Varden escapement was similar to the 1996-1998 average run-timing. The magnitude of the 1999 Dolly Varden escapement was similar to the 1996 and 1995 level (Figures 22 and 27).

Beach seine sampling was successful in achieving sufficient scales for age and length determination.

Difficulties encountered over the years while counting from the tower included species identification problems at the far end of the flash panel during times of poor visibility, severe glare from sunlight in the evening, spawning fish covering portions of the flash panel with gravel, and occasional wind turbulence that made species identification problematic along the length of the flash panel. Counting accuracy decreases when the rate of passage increases.

ACKNOWLEDGEMENTS

Carl “Bones” Brown was the crew leader for the entire season. Liz Korenek worked as a crew member until 19 August. Gus Kasnoc was a Norton Sound Economic Development Corporation (NSEDC) intern. NSEDC hired and provided funding for the interns. Gary Knuepfer of ADF&G provided assistance and expertise as needed throughout the season. A draft of this report was reviewed by Larry Buklis.
